

A background image showing a close-up of a water splash, with a central stream of water falling into a pool, creating ripples. The image is tinted with a blue color scheme.

About TwistHDM

TwistHDM went live in October 2008 when it became clear to our team that our first product, called “LimeLight” could fill a void. TwistHDM (the HDM stands for “High Density Mesh”) exists to take this powerful mesh tool and apply it to unique niches in the marketplace – niches that have yet to be able to even dream of the possibilities of managing light in a more prudent way. This high density mesh is the backbone of solutions that open doors to the potential of reducing energy by 65% or more, enhancing the safety of patrons, and providing efficiencies and information that drive down cost and increase bottom lines. Now that we have this capability, our team views the aggressive commercialization of TwistHDM and products such as LimeLight as a social responsibility – for when you have something that others can significantly benefit from, aren’t we all responsible to shout it out to the world? In short, TwistHDM deserves to exist - for the benefit of all. And we believe this – wholeheartedly.
